Structured Board Review 1402 Questions: GI 1-5; Child. 37-41; MSK 21-29; Adults 71-80

GI

1.	A patient with risk factors for hepatitis C virus (HCV) has a positive HCV antibody test. Which one of the following additional tests is most important for deciding whether the patient should receive antiviral drugs to treat HCV infection?
O	A. Genotype testing.
0	B. Hepatitis C RNA (viral load).
0	C. Liver biopsy.
0	D. Liver transaminase levels.
0	E. Liver ultrasound.
2.	Which one of the following is the most common side effect experienced by patients who receive standard treatment for hepatitis C virus with pegylated interferon alfa and ribavirin?
0	A. Depression.
0	B. Flu-like symptoms of fatigue, headache, and fever.
0	C. Hemolytic anemia.
0	D. Irritability and insomnia.
0	E. Thyroiditis.
3.	Test results for a patient who is positive for hepatitis B surface antigen include positive total antibodies to hepatitis B core antigen, negative immunoglobulin M antibodies to hepatitis B core antigen, and negative antibodies to the hepatitis B surface antigen. Which one of the following is the correct interpretation of these results?
0	A. Chronic infection.
0	B. Early acute infection.
0	C. False-positive result (not infected).
0	D. Past infection resolved; currently immune.
0	E. Acute infection resolving.
4.	Which one of the following statements most accurately represents the recommendations for immunization against hepatitis A virus in patients with chronic hepatitis B or C virus?

0	A. Hepatitis A immunization is recommended for patients with hepatitis B or C virus, regardless of status of immunity to hepatitis A virus.
0	B. If not already immune to hepatitis A virus, hepatitis A immunization is recommended for patients with hepatitis B virus but not hepatitis C virus.
0	C. If not already immune to hepatitis A virus, hepatitis A immunization should be given to patients with hepatitis B or C virus.
0	D. If not already immune to hepatitis A virus, hepatitis A immunization is recommended for patients with hepatitis C virus but not hepatitis B virus.
5.	For patients with hepatitis B or C virus who are at high risk for hepatocellular carcinoma (HCC), which one of the following is the appropriate interval at which to perform ultrasound screening for detection of HCC?
0	A. Every 3 to 6 months.
0	B. Every 6 to 12 months.
0	C. Every 2 years.
0	D. Every 3 years.
0	E. Every 5 years.
Child	ren
37.	Which one of the following is an established risk factor for the development of functional abdominal pain in children?
0	A. Physical abuse.
0	B. Sexual abuse.
0	C. Lower socioeconomic status.
0	D. Helicobacter pylori infection.
38.	Which one of the following is a red flag sign/symptom finding in the evaluation of a child with recurrent abdominal pain?
0	A. Rapid weight gain.
0	B. Constipation.
0	C. Predominantly left-sided pain.
0	D. Diffuse abdominal tenderness.
0	E. Oral ulcers.

39.	Which diagnostic investigations are appropriate for a 10-year-old boy who meets the criteria for functional abdominal pain and has no red flag findings on history and physical examination?
0	A. No testing is indicated.
0	B. Complete blood cell count.
0	C. Erythrocyte sedimentation rate.
0	D. C-reactive protein.
0	E. Tests of liver function.
40.	Which one of the following interventions has the best evidence of benefit for children with functional abdominal pain?
0	A. Dietary probiotics.
0	B. Cognitive-behavioral therapy.
0	C. Fiber supplementation.
0	D. Meditation.
0	E. Peppermint oil.
41.	Which one of the following is the most common cyanotic congenital heart disease identified in the first week after birth?
0	A. Coarctation of the aorta.
0	B. Hypoplastic left heart syndrome.
0	C. Tetralogy of Fallot.
0	D. Transposition of great arteries.
0	E. Ventricular septal defect.
Musc	uloskeletal
21.	A patient presents with heel pain that has increased in severity over the past 3 months. She has tried heel cup inserts with little improvement. Which of the following helps establish the diagnosis of plantar fasciitis?
0	A. Pain extending from the heel into the second and third toes.
0	B. Pain that is least severe upon first heel strike and becoming worse after the first few steps.

0	C. Pain elicited during the tarsal tunnel syndrome test after 5 to 10 seconds.
0	D. Pain elicited with passive plantarflexion of the talocrural joint.
0	E. Palpation of the Achilles tendon.
22.	The predominant goal of plantar fasciitis treatment is to maximize pain relief and restore function. Which of the following initial steps should be considered for such treatment?
\circ	A. Weight loss.
0	B. Replacement of worn shoes.
0	C. Customized shoe inserts.
0	D. Corticosteroid injection.
0	E. Both A and B.
23.	Although customized foot orthoses appear to be more effective plantar fasciitis treatment than no shoe insert or night splints, they might not be more effective than which of the following?
0	A. Prefabricated orthoses.
0	B. Routine plantar stretching.
0	C. Physical therapy.
0	D. All of the above.
0	E. None of the above.
24.	A patient with plantar fasciitis returns for a follow-up visit after 2 weeks of treatment with acetaminophen and calf stretching exercises. She continues to have heel pain. Which of the following would you recommend based on strong supporting evidence?
0	A. Dorsiflexion night splints.
0	B. Custom foot orthoses.
0	C. Corticosteroid injection in the plantar fascia.
0	D. Extracorporeal shock wave therapy.
0	E. Surgical treatment.

25.	After successful treatment with a corticosteroid injection in the plantar fascia, a patient returns with recurrent pain. You are concerned that repeated injection may cause fat pad atrophy and recommend a trial of low-energy extracorporeal shock wave therapy (ESWT). What should y tell your patient about this treatment?
0	A. Anesthesia will be needed.
0	B. ESWT is more effective than physical therapy.
0	C. ESWT acts to stimulate soft-tissue healing and reduce pain.
0	D. Most insurance companies will reimburse the cost of ESWT.
0	E. Studies consistently show benefit.
26.	A 52-year-old woman who just completed treatment for a corn between the fourth and fifth toes asks about prevention. She has no obvious foo deformities. Which of the following options would you advise?
0	A. Low-heeled shoes with a soft, wide toe box.
0	B. High-heeled shoes with a soft toe box.
0	C. Loose-fitting shoes.
0	D. Extra changes of shoes.
0	E. Offloading shoe inserts.
27.	A 64-year-old woman with a recalcitrant callus under the second metatarsal head requests surgery. Which of the following options would you advise?
0	A. Surgery to change foot mechanics.
0	B. Surgery to remove the callus.
0	C. Surgery to remove bony prominences.
0	D. Surgery should be avoided and conservative treatment used.
0	E. All of the above.
28.	A 52-year-old woman presents with a painful, rough, skin-colored lesion on the bottom of her right foot. Which of the following would help confirm a plantar wart?
0	A. Lesion does not obscure skin markings.
0	B. Thrombosed capillaries evident when paring down the lesion.

25.

0	C. Wickham striae.
0	D. Horn cysts within the lesion.
0	E. Pigmented, <i>stuck</i> on appearance.
29.	Which of the following is considered first-line treatment for plantar warts?
0	A. Topical salicylic acid.
0	B. Topical dinitrochlorobenzene.
0	C. Cryotherapy.
0	D. Imiquimod 5% cream.
0	E. 5-Fluorouracil 5% cream.
Adul	ts
71.	Which one of the following statements most accurately describes the etiology of traveler's diarrhea (TD)?
0	A. Approximately 30% of cases are attributed to enteropathic viruses.
0	B. Approximately 5% of cases are attributed to intestinal parasites.
0	C. Approximately 50% of cases are attributed to bacteria.
0	D. The most common etiology of TD is enterotoxigenic <i>Escherichia coli</i> .
72.	Which one of the following statements reflects the most appropriate regimen for antibiotic management of traveler's diarrhea?
0	A. Ciprofloxacin 250 to 500 mg 2 times/day for 1 to 3 days.
0	B. Ciprofloxacin 750 mg, repeat after 12 hours.
0	C. Azithromycin 500 mg on 3 consecutive days.
0	D. Ofloxacin 1,000 mg once.
0	E. Levofloxacin 500 mg 3 times/day for 1 to 3 days.
73.	Which one of the following statements most accurately describes a health risk from consuming fish?

0	A. Anisakiasis typically manifests as profuse watery diarrhea within hours of consuming raw fish.
0	B. Ciguatera poisoning manifests as acute gastrointestinal symptoms within 1 to 3 hours of consuming contaminated large predatory reef fish
0	C. Neurologic symptoms can occur early in ciguatera poisoning.
0	D. Scombroid poisoning occurs 1 to 3 days after consuming contaminated freshwater fish.
0	E. Raw or undercooked saltwater tuna can transmit liver flukes.
74.	Which one of the following statements about animal and insect injuries is most accurate?
0	A. After a tick bite in an endemic area, doxycycline 4 mg/kg is indicated for Lyme disease prophylaxis.
0	B. After an insect bite in an endemic area, amoxicillin 500 mg 2 times/day for 3 days is indicated for scrub typhus prophylaxis.
0	C. Snake bites are the third most common animal-related injury in US tourists overseas.
0	D. Jellyfish stings should be immersed in cold, fresh water promptly.
75.	Which one of the following statements about sun exposure is most accurate?
0	A. To be effective, sunscreens should have a sun protection factor of at least 10.
0	B. Sunscreen may be applied simultaneously with <i>N</i> , <i>N</i> -diethyl-3-methylbenzamide (DEET).
0	C. Sunscreen should be applied immediately before sun exposure to prevent loss of protection though absorption into the skin.
0	D. Topical steroids are effective for sunburn management.
0	E. Photosensitivity is a risk of doxycycline and chloroquine.
76.	Which one of the following statements about stand-by emergency treatment (SBET) for malaria is most accurate?
0	A. It should be offered to all travelers to endemic areas.
0	B. It should be offered to all travelers to chloroquine-resistant areas.
0	C. It is no longer recommended because modern chemoprophylaxis is safe and effective.
0	D. In chloroquine-sensitive areas, a 3-day course of chloroquine treatment is recommended for SBET.

Which one of the following statements about travel to high altitudes is most accurate?

77.

0	A. Altitude-related symptoms are uncommon below 3,500 m (11,483 ft).
0	B. Children are less likely to develop altitude-related symptoms than adults.
0	C. Physical conditioning before ascent reduces the risk of altitude sickness.
0	D. Up to 50% of travelers to elevations of 4,000 m (13,124 ft) experience symptomatic altitude sickness.
0	E. Prophylactic acetazolamide is safe during pregnancy and while breastfeeding.
78.	Which one of the following statements about the symptomatic returned traveler is most accurate?
0	A. Approximately 15% of travelers seek medical attention for symptomatic illness on returning to the United States.
0	B. Fever is an urgent sign in the returned traveler.
0	C. Nausea and vomiting are among the most common symptoms reported by returned travelers.
0	D. Pulmonary embolism is the most common cause of new-onset cough within 3 days of completed air travel.
0	E. Cutaneous complaints are uncommon in returned travelers.
70	Which are of the following statements shout dangue fover is most accurate?
79. O	Which one of the following statements about dengue fever is most accurate? A. The incubation period typically is 3 weeks.
0	A. The incubation period typically is 3 weeks.
0	A. The incubation period typically is 3 weeks. B. Children with dengue fever might present with shock.
0 0	A. The incubation period typically is 3 weeks.B. Children with dengue fever might present with shock.C. Nonsteroidal anti-inflammatory drugs are recommended to relieve dengue fever.
0 0 0	 A. The incubation period typically is 3 weeks. B. Children with dengue fever might present with shock. C. Nonsteroidal anti-inflammatory drugs are recommended to relieve dengue fever. D. Patients with dengue fever typically experience moderate, intermittent fevers.
© © © 80.	 A. The incubation period typically is 3 weeks. B. Children with dengue fever might present with shock. C. Nonsteroidal anti-inflammatory drugs are recommended to relieve dengue fever. D. Patients with dengue fever typically experience moderate, intermittent fevers. Which one of the following statements about skin conditions in travelers is most accurate?
0 0 0	 A. The incubation period typically is 3 weeks. B. Children with dengue fever might present with shock. C. Nonsteroidal anti-inflammatory drugs are recommended to relieve dengue fever. D. Patients with dengue fever typically experience moderate, intermittent fevers. Which one of the following statements about skin conditions in travelers is most accurate? A. Cutaneous larva migrans can be contracted by walking barefoot on a contaminated beach.
6 6 80.	A. The incubation period typically is 3 weeks. B. Children with dengue fever might present with shock. C. Nonsteroidal anti-inflammatory drugs are recommended to relieve dengue fever. D. Patients with dengue fever typically experience moderate, intermittent fevers. Which one of the following statements about skin conditions in travelers is most accurate? A. Cutaneous larva migrans can be contracted by walking barefoot on a contaminated beach. B. Scabies usually is managed with albendazole 400 mg as a single dose.
